IMPORTANT

READ ALL OF THE FOLLOWING WARNINGS AND STATEMENTS BEFORE READING THE INSTALLATION INSTRUCTIONS

WARNING
LIQUEFIED PETROLEUM (L.P.) PROPANE FIRED GAS BOILERS

Installation location ONLY as permitted in paragraph entitled "LIQUEFIED PETROLEUM (L.P.) PROPANE GAS FIRED BOILER LOCATION" on page 3 of this instruction book. The above warning does not apply to NATURAL gas fired boilers.

The installation must conform to the requirements of the authority having jurisdiction or, in the absence of such requirements, to the National Fuel Gas Code, ANSI Z223.1-latest edition. The installation must also conform to the additional requirements in this Slant/Fin Instruction Book.

In addition, where required by the authority having jurisdiction, the installation must conform to American Society of Mechanical Engineers Safety Code for Controls and Safety Devices for Automatically Fired Boilers, No. CSD-1.

This manual must be left with owner and should be hung on or adjacent to the boiler for reference.

WARNING
This boiler, gas piping and accessories must be installed, connected, serviced and repaired by a trained, experienced service technician, familiar with all precautions required for gas fired equipment and licensed or otherwise qualified, in compliance with the authority having jurisdiction.
DIMENSIONS

GALAXY

ORIFICE SIZES indicated for Sea Level are factory installed in boiler unless otherwise specified by the local authority. See VII, page 8 for burner input adjustment.

GAS VALVE CONNECTION Size may be 3/4" or 1/2" depending upon configuration (natural, L.P.).

COMBUSTIBLE FLOOR KIT increases all height dimensions by 1”.

RAISED SLAB - When mounting boiler on a raised slab, the slab must extend at least 2" beyond the boiler cabinet on all sides.

CHIMNEY HEIGHT: 15 FT. Minimum from draft hood skirt to top of chimney.

CHIMNEY INSIDE DIAMETER must be same as Dimension “C” or larger. Larger diameter &/or height may be required if two or more boilers or a boiler and another appliance are vented to a single chimney.

ORIFICE SIZES AT HIGH ALTITUDES INCLUDES 4% INPUT REDUCTION FOR EACH 1000 FEET

INSTALLATION REQUIREMENTS

The installation must conform to the requirements of the authority having jurisdiction or, in the absence of such requirements, to the National Fuel Gas Code, ANSI Z223.1-latest edition. This installation must also conform to the additional requirements in this Slant/Fin instruction book. Installation and service to be performed by a qualified installer, service agency or the gas supplier.

NATURAL GAS FIRED BOILER LOCATION—

Provide a level, solid foundation for the boiler. Location should be as near the chimney as possible so that the flue pipe from boiler to chimney is short and direct.

Automatic gas ignition system components shall be installed so these components will not be subjected to dripping water during installation or service.

CHIMNEY REQUIREMENTS—

A. Galaxy boilers may be vented into a masonry vitreous tile-lined chimney or UL LISTED type "B" venting system NOT EXPOSED to the OUTDOORS below the roof line. Venting and sizing of venting system must be in accordance with Part 7, Part 11 and Appendix G of the National Fuel Gas Code ANSI Z223.1, NFPA 54, -latest edition which will be referred to as the National Fuel Gas Code. Local codes apply.

If a masonry chimney is exposed to the outdoors on one or more sides below the roof line (exterior chimney), ONE of the following options apply:

1. Chimney must be re-lined with a UL LISTED metallic liner. When this is done, the chimney will be considered NOT exposed to the outdoors and the requirements of the National Fuel Gas Code for NON-exposed chimneys and/or local codes will apply.

2. If an exposed tile-lined chimney is to be used WITHOUT a UL LISTED metallic liner, the boiler must meet the requirements of the National Fuel Gas Code:

B. If an existing boiler is removed from a common venting system, the common venting system may be too large for proper venting of the remaining appliances connected to the common vent. Follow the test procedure shown in Appendix "A" on page 15 of this manual to insure proper operation of venting system and appliances.

C. Inspect for proper and tight construction. Any restrictions or obstructions must be removed. An existing chimney may require cleaning.

D. Chimney or vent must extend at least 3 feet above its passage through a roof and at least 2 feet above any ridge within 10 feet of the chimney.

BOILER FOUNDATION

A. Provide a solid, level foundation, capable of supporting the weight of the boiler filled with water, and extending at least 2" past the jacket on all sides. See dimensions of boilers, page 2.

B. For installation on non-combustible floors only.*

C. If boiler is to be located over buried conduit containing electric wires or telephone cables, consult local codes or the National Board of Fire Underwriters for specific requirements.

* The Combustible Floor Kit part number printed on the boiler rating plate is the only one to be used when installing on combustible floors. The boiler must not be installed on carpeting.

WARNING

SPECIAL ATTENTION FOR LIQUEFIED PETROLEUM (L.P.) PROPANE GAS-FIRED BOILER INSTALLATIONS

LPG appliances (boilers) shall be installed in accordance with applicable provisions of NFPA 58 (Liquefied Petroleum Gas Code) latest edition for installations in US and CAN/CGA B149.1 latest edition for installations in Canada.

Liquefied Petroleum (LP) propane gas is heavier than air therefore Propane gas accumulate at floor level. If you suspect a leak, do not attempt to operate boiler. A spark or flame from the appliance (boiler) or other sources may ignite the accumulated propane gas causing an explosion or fire. It is recommended that inspections for gas leaks be performed periodically by licensed professional and that leak detection devices be installed as a further safety measure.
MINIMUM CLEARANCES FROM COMBUSTIBLE CONSTRUCTION —
A. Minimum boiler clearances shall be as follows:

<table>
<thead>
<tr>
<th>GALAXY GG SERIES</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODELS GG-300 THROUGH GG-399H. MINIMUM CLEARANCE FOR COMBUSTIBLE CONSTRUCTION.</td>
</tr>
<tr>
<td>MINIMUM ACOVE CLEARANCE.</td>
</tr>
<tr>
<td>Front ................................................. Alcove</td>
</tr>
<tr>
<td>Rear ................................................... 6&quot;</td>
</tr>
<tr>
<td>Left Side ............................................. 6&quot;</td>
</tr>
<tr>
<td>Right Side .......................................... 6&quot;</td>
</tr>
<tr>
<td>Top .................................................... 36&quot;</td>
</tr>
<tr>
<td>Flue Connector ...................................... 6&quot;</td>
</tr>
<tr>
<td>Type 'B' Vent ....................................... 1&quot;</td>
</tr>
</tbody>
</table>

B. Provide accessibility clearance of 24" on sides requiring servicing and 18" on sides used for passage.
C. All minimum clearances shown above must be met. This may result in increased values of some minimum clearances in order to maintain the minimum clearances of others.
D. Clearance from steam and hot water pipes shall be 1". **
** At points where hot water or steam pipes emerge from a floor, wall or ceiling, the clearance at the opening through the finished floor boards or wall or ceiling boards may be not less than 1/2". Each such opening shall be covered with a plate of noncombustible material.

SAFETY —
KEEP THE BOILER AREA CLEAR AND FREE FROM COMBUSTIBLE MATERIALS, GASOLINE AND OTHER FLAMMABLE VAPORS AND LIQUIDS.

VENT PIPING —
A. Vent piping installation must be in accordance with ANSI Z223.1-latest edition, National Fuel Gas Code, Part 7, Venting of Equipment. Other local codes may also apply and must be followed.
B. Boiler vent pipe must be the full diameter of the boiler draft hood outlet. See dimensions, page 2. If a vent damper is added, its diameter must be equal to the hood outlet and must be located past the hood outlet. See installation instructions furnished with vent damper and in the section "Vent Damper Installation" of this instruction book.
C. If more than one appliance vents into a common breeching, the area of the breeching must be equal to the area of the largest vent plus 50% of the area of the additional vent areas. Vent connectors serving appliances vented by natural draft shall not be connected into any portion of mechanical draft systems operating under positive pressure. Horizontal breeching or vent pipe should be as high as possible, consistent with codes, so that vertical vents from appliances will have a high rise above draft diverter openings. All horizontal runs must slope upwards not less than 1/4 inch per foot of run. Horizontal portions of the venting system must be supported to prevent sagging by securing each joint with metal screws and by providing hangers spaced no greater than 5 feet apart.
D. Vent or breeching into chimney should not be inserted past the inside wall of the chimney liner.
E. All venting means should be inspected frequently. See Care and Maintenance and separate User’s Information Manual.

GAS PIPING —
A. Local installation codes apply. The pipe joint compound used on threads must be resistant to the action of liquefied petroleum gases.
B. The gas supply line to the boiler should be run directly from the meter for natural gas or from the fuel tank for L.P. or propane gas. See page 2 for location of union and manual shut-off valve that may be specified locally. Selecting pipe size for natural gas:
1. Measure or estimate the length of piping from the meter to the installation site.
2. Consult gas supplier for heating value of gas (BTU/cu. ft.).
3. Divide boiler rated input by heating value to find gas flow in piping (cu. ft. per hour).
4. Use table below to select proper pipe size.
Example: Boiler model GG-300 is to be installed. Distance from gas meter to the boiler is 50 ft. Heating value of natural gas is 1020 BTU/cu. ft. Select proper pipe size.

\[
\text{Gas flow} = \frac{300,000 \text{ BTU/hr}}{1020 \text{ BTU/cu. ft.}} = 294 \text{ cu. ft. per hour}
\]

At 50 ft. length of pipe, match required capacity from table below (choose higher capacity, in this case is 440 cu. ft. per hour). Required pipe size is 1-1/4". Improper gas pipe sizing will result in pilot flame outages, insufficient heat and other installation difficulties. For more information and also if other appliances are to be attached to the piping system, see Appendix C of National Fuel Gas Code ANSI Z223.1-latest edition.
C. The boiler and its gas connection must be leak tested before placing the boiler in operation. Use liquid soap solution for all gas leak testing. Do not use open flame. This boiler and its individual shut-off valve must be disconnected from the gas supply piping system during any pressure testing of that system at test pressures in excess of 1/2 PSIG.
This boiler must be isolated from the gas supply piping system by closing its individual manual shut-off valve during any pressure testing of the gas supply piping system at test pressures equal to or less than 1/2 PSIG.
D. All gas piping used should be inspected thoroughly for cleanliness before makeup. A sediment trap must be provided, as illustrated on page 2.

E. The minimum and maximum gas supply pressure (at the inlet of gas valve) are shown on the boiler rating plate for the type of gas used. Gas supply pressure should never be less than minimum or more than maximum pressure when the boiler or any other appliance is turned on or off.

ELECTRICAL WIRING
DANGER: Before wiring, always turn off electric power supply, otherwise shock or death can result.

Power Supply
A separately fused circuit is recommended. Use a standard 15 Amp. fuse or breaker and 14 gauge conductors in BX cable or circuit. Provide disconnect means and overload protection as required. See boiler wiring diagram (Figure 6). Boiler must be electrically grounded in accordance with requirements of the authority having jurisdiction, or, in the absence of such requirements, with the National Electrical Code, ANSI/NFPA 70-latest edition.

BOILER ROOM AIR SUPPLY AND VENTILATION
An ample supply of air is required to obtain combustion and ventilation. Room temperature over 100°F may cause nuisance tripping of the Blocked Vent Safety Switch.

All air must come from outside, directly through wall openings to the boiler or through unsealed openings around windows, doors, etc. in the whole building. When buildings are insulated, caulked and weather-stripped, now or later on, direct opening to outside may be required and should be provided. If the boiler is not on an outside wall, air may be ducted to it from outside wall openings.

The National Fuel Gas Code, ANSI Z223.1-latest edition specifies openings for air under various conditions. Local codes may specify minimum opening sizes and locations. The following recommendation applies to buildings of energy-saving construction, fully caulked and weather stripped:

Provide one GRILLED opening near the floor and one near the ceiling on an outside wall near the boiler (or duct from such openings to the boiler). Each opening to be a minimum of one square inch per 2000 Btu input to all appliances in the area. For a total appliance input of 200,000 Btu, each opening will be 100 square inches. A grilled opening 10" x 10" has 100 square inches of area. If fly screen must be used over openings, double the area and inspect and clean the screen frequently.

Openings must NEVER be reduced or closed. If doors or windows are used for air supply, they must be locked open. Protect against closure of openings by snow and debris. Inspect frequently.

NO MECHANICAL DRAFT EXHAUST OR SUPPLY FANS ARE TO BE USED IN OR NEAR THE BOILER AREA.

The flow of combustion and ventilating air to the boiler must NOT be obstructed.

DRAFT HOOD—
The draft hood supplied is part of the listed boiler assembly. DO NOT alter the hood. See dimensions, page 2.

Attach the hood to the boiler flue outlet. Connect flue pipe full size of hood outlet. If a vent damper is added, it must be installed in the outlet side of the hood. See Vent Piping.
VENT DAMPER INSTALLATION
The vent damper referred to in the following instructions is the Slant/Fin Corporation vent damper.
I. This device is design certified by C.S.A. for use ONLY on specific Slant/Fin Corp. gas boiler models. These boilers must also be equipped with a plate which states that the boiler must or may be used with a Slant/Fin Corp. automatic vent damper device and indicates the proper vent damper model number.
II. INSTALLATION INSTRUCTIONS BEFORE YOU START TO INSTALL
1. Read this installation manual, the "DANGER" plate attached to the top of the boiler, the "WARNING" on the wiring diagrams, vent damper carton and operator cover.
2. Perform pre-installation inspection as required by ANSI specification Z21.66.
3. Turn off all electrical power, gas supply and wait for system to cool (for previously installed boilers).
4. Select a proper, convenient location (see figures 1 & 2).
5. Carefully unpack the unit. DO NOT FORCE IT OPEN OR CLOSED! Forcing the damper may damage the gear train and void the warranty.

WARNING—DANGER
Once you have begun vent damper installation procedure, DO NOT restore electric power and gas supply until installation and inspection have been completed (in order to prevent the main burners from operating). DO NOT operate the boiler until the vent damper harness "RECEPTACLE B" is plugged into "MALE PLUG" (as described in the installation instructions), and the vent damper installation and checkout procedures have been completed. Failure to observe this warning may create a hazardous condition that could cause an explosion or carbon monoxide poisoning.

B.1. This device must be installed after the appliance draft hood (between the draft hood outlet and the connector to the outdoor chimney or vent) as close to the draft hood as practicable, and without modification of the draft hood or the damper. (See figures 1 & 2.)
2. The inlet size of the vent damper must be the same nominal trade size as the outlet of the draft hood.
3. This device must be located in a venting system or section of a venting system so that it serves only the single appliance for which it is installed. (See figure 3.)
4. Clearances of not less than 6 inches (152MM) must be maintained from combustible materials, with provisions for access for service.

C. NOW, PROCEED AS FOLLOWS:
1. Remove the front cover of the boiler exposing the wiring compartment. With all electrical power to boiler off, locate "MALE PLUG" and "Receptacle A" (see wiring diagram attached to boiler); a copy of this may also be found in this manual.
   Cut the RED wire connected between numbers 3 and 4 of "RECEPTACLE A" (the only wire connected to this receptacle) and then disconnect "RECEPTACLE A" from "MALE PLUG". Remove "RECEPTACLE A" from job site and discard.
2. Separate the vent pipe directly on top of the draft hood and place damper in position as shown in figures 1 & 2.
   The vent damper must be installed so that the damper position indicator is in a visible location after installation. The arrow imprint on the damper should point in direc-
tion of vent gas flow (towards chimney). Re-assemble the vent piping. Be sure the vent damper is well seated and fastened with 3 sheet metal screws. Screws should be no longer than 1/2 inch. See figure 3.

3. Boilers that may have vent damper are factory wired with plug and “RECEPTACLE A”. To install the vent damper all that is required is removal of the “RECEPTACLE A” and connection of the vent damper harness to the boiler plug. Boilers that must have a vent damper are factory wired with plug only. (Remove “RECEPTACLE A” from job site and discard.)

   a) Attach the flexible metallic conduit vent damper harness to the right hand side of the jacket by passing the free end of the harness through the 7/8 diameter hole in the top of the jacket, and using the BX connector at the free end of the metallic conduit, fasten to jacket.

   b) Connect “RECEPTACLE B” (free end of vent damper harness) into “MALE PLUG” (see wiring diagram).

4. Restore electrical power and turn on gas supply.

D. AFTER INSTALLATION:

1. Operate system through two complete cycles to check for opening and closing in proper sequence, and proper burner operation. DAMPER MUST BE IN OPEN POSITION WHEN BOILER MAIN BURNERS ARE OPERATING.

2. Perform installation checks as required by ANSI specification Z21.66.

3. Replace the front cover of the boiler.

4. Check the trouble-shooting section if problems arise with the installation.

E. THERMOSTAT HEAT ANTICIPATOR ADJUSTMENTS

If the 24v room thermostat that controls this boiler has an adjustable heat anticipator, connect entire system to thermostat and run the system while measuring the current drawn through the thermostat wires. Set the heat anticipator at the value measured. The set current should match power requirements by zone valves and relays. Add an additional 0.1 Amp to the measured current for vent damper. Refer to the manufacturer’s instruction of zone valve, vent damper and relays. Also, see instructions with the thermostat.
SAFETY INFORMATION
FOR YOUR SAFETY READ BEFORE OPERATING

WARNING: If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

A. This appliance is equipped with an ignition device which automatically lights the pilot. DO NOT try to light the pilot by hand.
B. BEFORE OPERATING smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

WHAT TO DO IF YOU SMELL GAS
• DO NOT try to light any appliance.
• DO NOT touch any electric switch; DO NOT use any phone in your building.
• Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.
• If you cannot reach your gas supplier, call the fire department.

C. Use only your hand to push in or turn the gas control knob. NEVER use tools. If the knob will not push in or turn by hand, don't try to repair it, call a qualified service technician. Force or attempted repair may result in a fire or explosion.
D. DO NOT use this appliance if any part has been under water. Immediately call a qualified service technician to inspect the appliance and to replace any part of the control system and any gas control which has been under water.

Operating Instructions
1. STOP! Read the safety information on this page.
2. Set the thermostat to lowest setting.
3. Turn off all electric power to the appliance.
4. This appliance is equipped with an ignition device which automatically lights the pilot. DO NOT try to light the pilot by hand.
5. Remove control access panel.
6. Turn gas control knob clockwise to "OFF". Do NOT force.
7. Wait five (5) minutes (longer for propane) to clear out any gas, then smell for gas, including near the floor. If you then smell gas, STOP! Follow "B" in the safety information on this page. If you don't smell gas, go to next step.
8. Turn gas control knob counterclockwise to "ON".
9. Replace control access panel.
10. Turn on all electric power to the appliance.
11. Set thermostat to desired setting.
12. If the appliance will not operate, follow the instructions "To Turn Off Gas To Appliance" and call your service technician or gas supplier.

To Turn off gas to appliance
1. Set the thermostat to lowest setting.
2. Turn off all electric power to the appliance if service is to be performed.
3. Remove control access panel.
4. Turn gas control knob clockwise to "OFF". Do NOT force.
5. Replace control access panel.

BURNER ADJUSTMENT
A. Adjust gas input rate:
1. Consult gas supplier for heating value of gas (Btu/cu.ft.).
2. Set thermostat high enough so that boiler will remain on while checking rate.
3. Measure manifold pressure at 1/8" tapping. Correct manifold pressure for gas used is printed on boiler rating plate. NOTE: Gas pressure may be adjusted by turning pressure regulator screw on combination gas valve (Turn clockwise to increase pressure, counter clockwise to decrease pressure).
   a. Input for PROPANE is approximately at rating shown on rating plate when manifold pressure is 9-1/2" water column.
   b. Input for NATURAL GAS is approximately at rating when manifold pressure is 3-1/2" water column, but should be checked on the gas meter:
      Btuh Input = Btuh/cu. ft. x cu. ft. metered in 3 minutes x 20
GALAXY

C. Main Burner Ignition Check-out and Pilot Adjustment

1. The pilot flame must not smother or snuff out when tested as follows:
   a. Main burner ignition from cold start-repeat.
   b. Continued operation of main burner.
   c. Main burner ignition with appliance at maximum operating temperature after prolonged operation.
   NOTE: Observe operation of the pilot burner with appliance doors in the final operating position. Use of a mirror may be helpful.

2. Safety Shutdown Check-out
   a. Make certain the pilot burner holds in, and opens properly, when the pilot is burning normally; and that safety shutdown occurs within 2-1/2 minutes after the pilot flame is extinguished. Observe operation for at least one cycle under automatic control to be sure the system is functioning normally.
   b. For proper operation the pilot should engulf the flame sensor as shown below.
   c. To adjust pilot, turn pilot flow adjustment screw on valve clockwise or counterclockwise to give a steady flame enveloping 3/8” to 1/2” of the tip of the flame sensor. Note that turning the pilot adjustment screw clockwise will decrease the pilot flame.
   d. Check safety shutdown of gas valve by following procedure outlined “CARE AND MAINTENANCE” section.

CONTROLS, SAFETY CHECK

Check all safety controls not previously mentioned. Also, follow directions in “CARE AND MAINTENANCE” section, paragraphs IV through VII.

These boilers are equipped with both a draft hood blocked vent safety switch and a rollout safety switch. The blocked vent safety switch is located on the draft hood flue stack. This is a manual reset control used to prevent excessive spillage of flue gases from the draft hood. The rollout safety switch is a single use (one time) thermal fuse to prevent the boiler from operating if flue passages are blocked. If either of these devices shut down the burners, follow instructions in the section "To Turn Off Gas To Appliance" and call your service technician or gas supplier.

CARE AND MAINTENANCE

WARNING: THE FLOW OF COMBUSTION AND VENTILATING AIR TO THE BOILER SHOULD NOT BE OBSTRUCTED.

This section must be brought to the attention of the owner by the installer so that the owner can make the necessary arrangements with a qualified service agency for the periodic care and maintenance of this boiler. The installer must inform the owner that the gas supplier can recommend a number of qualified service agencies. The installer must also inform the owner that the lack of proper care and maintenance of this boiler and any fuel burning equipment may result in a hazardous condition.

(Continued on next page)
I. GENERAL MAINTENANCE

These operations are recommended to be performed at regular intervals:
A. BOILER HEATING SURFACES: clean off all coatings found.
B. BOILER CONTROLS: check contacts, settings, correct functioning.
C. PIPING: check piping and accessories for leaks.
D. CHIMNEY and BREECHING: check for obstructions and leaks.
E. BOILER ROOM AIR SUPPLY: check air vents for continued positive supply of air as required. Air needs are greatest in cold weather. Air vents must be open and free of obstruction.
F. WATER SYSTEM: check
   1. System to be full of water, and pressure to remain stable at correct setting on gauge.
   2. Air-control system: noise and air binding in radiation should not occur.
   3. Water lines: slightest leaks should be corrected.
   4. Low water cut-off, for operation (see instructions furnished with unit.)

II. WATER LEVEL CHECK DURING HEATING SEASON:

Regular loss of water from water boiler system may indicate either a system leak, or a faulty air-control system, or a faulty automatic fill valve.

III. ANNUAL INSPECTION AND CLEANING:

A. It is important that this boiler be inspected by a competent serviceperson to help insure safe and reliable operation.
B. Check for gas leaks from valve and gas piping to burners and pilot. If leaks are found, repair or replace as required.
C. This inspection should include:
   1. Controls check. See SAFETY CHECK, IV.
   2. Recheck of input gas rate to burners. See "Initial Start" paragraph in "Operating Instructions" section.
   3. Re-adjusting for best flame characteristics of main flame and pilot. See "Initial Start" paragraph in "Operating Instructions" section and see "Burner Adjustment" section.
   4. Burner and boiler flue passage cleanliness: BURNER AND FLUE CLEANING (see sketch). It is suggested that paper be placed on burners to collect any foreign material in cleaning flues.
   5. Remove draft hood, jacket top and flue cover.
   6. Use wire brush to clean flueways.
   7. Replace flue cover and re-seal with furnace cement. Replace jacket top and draft hood and reconnect to smoke pipe, using screws. Remove and dispose of paper and accumulated material.
   8. If burner surfaces are not clean, or if uneven flame indicates plugged burner ports, remove and clean burners.

NOTE—TO REMOVE BURNERS:

a. Remove holding wire clip at orifice.
b. Disconnect pilot at pilot mount, or disconnect pilot gas line at gas valve, before removing burners next to pilot.
c. Lift rear of burner and remove burner from orifice.
d. Clean and replace burners* and pilot. Adjust burners as described on "Burner Adjustment".

* To clean burners run a clean flue brush up the tube until all foreign matter is removed.

IV. SAFETY CHECK FOR CONTROL SYSTEM

A. High limit control test: Set thermostat high enough for boiler water temperature to reach high limit control setting. When this temperature is reached, the high limit switch should open, and the main gas valve should close automatically. If the high limit does not close the main gas valve, the valve, the high limit or the wiring is faulty. Repair or replace immediately.
B. Gas valve safety shutdown test:
   With main burners firing, disconnect the ignition cable from the Ignition Control. The gas valve should shut off the main burners. If the gas valve fails to shut down main burners when the test is performed, replace the gas valve.
C. Check for gas leaks from valve and gas piping to burners and pilot. If leaks are found, repair or replace as required.

V. A. Providing Protection from Freezing.

Anti-freeze is sometimes used in hydronic heating systems to protect against freeze-up in the event of power failure or control shutdown when the building is unoccupied. It should be recognized that unless the building is kept above freezing temperature by some means, the plumbing system is not protected.

Two types of anti-freeze may be used: ETHYLENE GLYCOL, used in automobiles, has desirable properties, but is toxic. Its use may be prohibited when system water/glycol solution is in contact with a potable water vessel (as with a tankless heater). PROPYLENE GLYCOL is used in the quick-freeze food industry; it is practically non-toxic. Its use may be permitted when tankless heaters are used. When anti-freeze must be used, inhibited propylene glycol is recommended. Useful information on the characteristics, mixing proportions, etc. of glycol in heating systems is given in Technical Topics No. 2A, available from the Hydronics Institute 34 Russo Place, Berkeley Heights, NJ 07922. Consult glycol manufacturers for sources of propylene glycol.

B. Water Treatment:

A good water treatment program will not only extend the useful life of this boiler but it will also save much of the time and expense of repairs made necessary by preventable occurrences.

A reputable water treatment company should be consulted to evaluate and determine the best overall treatment program for your boiler equipment.

VI. KEEP THE BOILER AREA CLEAR AND FREE FROM COMBUSTIBLE MATERIALS, GASOLINE, AND OTHER FLAMMABLE VAPORS AND LIQUIDS.
SEQUENCE OF OPERATION FOR GALAXY BOILERS EQUIPPED WITH INTERMITTENT PILOT IGNITION SYSTEM (IID).

1. THERMOSTAT CALLS FOR HEAT

2. HIGH-LIMIT CONTACTS CLOSED?

     - NO FURTHER ACTION

3. MODELS WITH VENT DAMPERS

4. L.P. PROPANE GAS (S8600M & S8670E) IGNITION TRIAL CONTINUES FOR 90 SECONDS. AFTER TRIAL FOR IGNITION, SYSTEM SHUTS OFF. AFTER 5 MINUTES MODULE RE-INSTATES TRIAL FOR IGNITION. IF PILOT FLAME NOT ESTABLISHED, IGNITION TRIAL, SYSTEM SHUT-OFF AND 5 MINUTES WAIT SEQUENCE REPEATS CONTINUOUSLY.

5. SPARK GENERATOR MODULE POWERED IGNITION SPARK STARTS AND PILOT VALVE OPERATOR OPENS.

6. NATURAL GAS IGNITION SPARK CONTINUES. PILOT VALVE REMAINS OPEN UNTIL SYSTEM IS RESET.

7. WHEN THERMOSTAT IS SATISFIED OR WHEN HIGH LIMIT, OR LOW WATER CUT-OFF CONTACTS ARE OPEN, VALVE OPERATORS CLOSE, VENT DAMPER CLOSES. SYSTEM GOES TO STANDBY.
CAUTION: Label all wires prior to disconnection when servicing control. Wiring errors can cause improper and dangerous operation. “Verify proper operation after servicing.”

FIGURE 6. Schematic wiring diagram
BURNERS FAIL TO OPERATE

**CAUSE**
1. Safety pilot out, or flame too low.
2. Gas supply valve shut off.
3. Electric switch open.
4. Blown or defective line fuse.
5. Operating or limit control contacts open or dirty.
6. Defective gas valve or pressure regulator; or plugged bleed line.
7. Defective low voltage transformer.
8. Obstruction at main burner orifice.
9. Break in wiring or loose contact at control terminals.
10. Improper wiring.
11. Improper controls.
12. Rollout or blocked vent safety switch open.

**REMEDY**
1. Check, clean, re-light. See instructions.
2. Open gas valve(s).
3. Close Switch.
4. Replace fuse.
5. Check Control. Clean contacts or replace control.
6. Repair or replace.
7. Replace aquastat.
8. Check, clean and reinstall.
9. Check with test-light and correct.
10. Check and correct in accordance with wiring diagrams included with appliance instructions.
11. Install proper controls.
12. Replace rollout switch (inspect flue passages prior to replacement) or reset blocked vent safety switch by depressing the reset button.

BURNERS WILL NOT SHUT OFF

**CAUSE**
1. Defective operating control, gas valve, or high limit control.
2. Improper wiring or short circuit.

**REMEDY**
1. Check, repair or replace.
2. Check wiring and controls.

FLASH BACK - BURNING AT ORIFICES

**CAUSE**
1. Manifold gas pressure too low.
2. Improper primary air adjustment.
3. Gas regulator bleed too slow.
4. Burrs on orifice.
5. Improperly drilled orifice plugs.
7. Adverse draft condition in boiler room.
8. Low main gas pressure.

**REMEDY**
1. Adjust to proper manifold pressure.
2. Adjust air to produce soft, clean flame.
3. Adjust bleed opening.
4. Remove burrs.
5. Install orifice plugs with proper drilling.
6. Repair or replace.
7. Check air supply and venting system.
8. Contact utility.
9. Correct to manufacturer’s recommendations.

DELAYED IGNITION

**CAUSE**
1. Pilot flame too low.
2. Pilot burner ports or pilot orifice clogged.
3. Burners or orifices out of alignment.
4. Excessive primary air.
5. Excessive burner input.
6. Adverse draft condition in boiler room.

**REMEDY**
1. Increase gas supply to pilot.
2. Clean ports or orifices.
3. Realign burners or manifold.
4. Adjust primary air shutters.
5. Check and reduce to input shown on rating plate.
6. Check air supply and venting system.

FUMES AND GAS ODORS

**CAUSE**
1. Leaks in gas piping or accessories.
2. Gas leaks in service line or meter connections.
4. Boiler flueways blocked with soot.
5. Undersized breeching or too many turns in breeching.
6. Adverse draft condition in boiler room.
7. Overfiring.

**REMEDY**
1. Locate leaks and repair.
2. Close service supply valve - shut down appliance and notify utility.
3. Check and repair chimney.
4. Clean flueways and adjust burners as described in the installation instructions.
5. Check manufacturer’s recommendations.
6. Check air supply and venting system.
7. Adjust gas input to that shown on boiler rating plate.

CONDENSATION IN BOILER FLUES OR IN VENT SYSTEM

**CAUSE**
1. Underfiring.
2. Boiler water maintained at too low a temperature level.
3. Long horizontal run of smokepipe.
4. Inadequate chimney or venting system.

**REMEDY**
1. Increase firing rate to that shown on rating plate.
2. Set low limit controls to maintain a higher water temperature. If boiler is not equipped with low limit replace with one which has a combination low limit/high limit aquastat.
3. Relocate boiler or insulate breeching.
4. Check chimney and venting recommendations.
PIPING A HEATING — COOLING SYSTEM TO A WATER BOILER AND CHILLER

Figure below illustrates a method of piping a heating-cooling system to a water boiler and a chiller. Hand valves (shown) or automatic valves must be installed to prevent circulation of chilled water in the boiler or hot water in the chiller.

The air-control system and pressure control system must operate with chiller only, or the boiler only, being valved to the piping system. Separate control devices on the boiler and chiller may be used, or a single set of air and pressure controls on the common piping may be preferred.

If the boiler is used to supply hot water to heating coils in air handling units, flow control valves or other devices must be installed to prevent gravity circulation of water in the coils during the cooling cycle.

IF REPLACEMENT PARTS ARE NEEDED

When parts are needed, refer to boiler model and serial number shown on the boiler name/rating plate. Refer to the following parts lists for part numbers; publication number GG-10PL for Galaxy GG Series. Whenever possible refer to the original order by number and date.

Control identification and replacement should not be attempted by unskilled personnel. Only simple, easily identified controls and parts may be obtained locally. All other controls and parts should be identified by and ordered from Slant/Fin.

Relief/Safety valves must be ASME rated for the pressure and gross output of the boiler.

Replacement parts are available from:
Slant/Fin Corp.
100 Forest Drive
Greenvale, NY 11548
Attn: Technical Service Dept.
APPENDIX A

Removal of Existing Boiler from Common Vent System

"At the time of removal of an existing boiler, the following steps shall be followed with each appliance remaining connected to the common venting system placed in operation, while the other appliances remaining connected to the common venting system are not in operation."

(a) Seal any unused openings in the common venting system.

(b) Visually inspect the venting system for proper size and horizontal pitch and determine there is no blockage or restriction, leakage, corrosion and other deficiencies which could cause an unsafe condition.

(c) Insofar as is practical, close all building doors and windows and all doors between the space in which the appliances remaining connected to the common venting system are located and other spaces of the building. Turn on clothes dryers and any appliance not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they will operate at maximum speed. DO NOT operate a summer exhaust fan. Close fireplace dampers.

(d) Place in operation the appliance being inspected. Follow the lighting instructions. Adjust thermostat so appliance will operate continuously.

(e) Test for spillage at the draft hood relief opening after 5 minutes of main burner operation. Use the flame of a match or candle, or smoke from a cigarette, cigar or pipe.

(f) After it has been determined that each appliance remaining connected to the common venting system properly vents when tested as outlined above, return doors, windows, exhaust fans, fireplace dampers and any other gas-burning appliance to their previous conditions of use."

(g) Any improper operation of the common venting system should be corrected so the installation conforms with the National Fuel Gas Code, ANSI Z223.1-latest edition. When resizing any portion of the common venting system, the common venting system should be resized to approach the minimum size as determined using the appropriate tables in Appendix G in the National Fuel Gas Code, ANSI Z223.1-latest edition.
